A polymer (the name means "many parts") is long chain molecule made up many repeating units, called monomers. Polymers can be natural (organic) or synthetic. They are everywhere: in plastics (bottles, toys, vinyl siding, packaging), cosmetics, shampoos and other hair care products, contact lenses, nature (crab shells, amber), food (proteins, starches, gelatin, gum, gluten), fabric, balls, sneakers, and even in your DNA!

Polymers, including natural proteins (such as DNA) and artificial materials (such as nylon and polyester), are examples of macromolecules. materials scientist

Someone who studies the ways in which the atomic and molecular structure of a material relates to its overall properties. Materials scientists can design new materials or analyze existing ones.

The Journal of Materials Science publishes papers that report significant original research results on, or techniques for studying, the relationships between structure, processing, properties, and performance of materials. Topics include metals, ceramics, glasses, polymers, electrical and electronic materials, composite materials, fibers, nanostructured materials, and materials for application in the life sciences.

Materials Science of Polymers | Taylor & Francis Group

Polymers are materials made of long, repeating chains of molecules. The materials have unique properties, depending on the type of molecules being bonded and how they are bonded. Some polymers bend...
