~~Charles Darwin—On the Origin of Species | Britannica~~

British naturalist Charles Darwin (1809-1882) began drafting Origin of Species in 1842, just six years after returning from his fateful five-year voyage aboard the HMS Beagle (1831-36). Heavily influenced by Sir Charles Lyell's Principles of Geology (1830-1833, a three volume work) and Thomas Malthus' An Essay on the Principle of Population (1798), Origin of Species was ultimately published in 1859.

by Means of Natural Selection. As the ship's naturalist, he made exhaustive observations of the geology and natural history of the region and collected numerous samples. The Voyage of the Beagle is an account of his activities as well as of his hypotheses on certain scientific phenomena. On the Origin of Species revolutionized natural science. It introduces the concepts of adaptation and natural selection, and explores the topic of evolution, which altered our understanding of the world.

WITH AN INTRODUCTION BY DARWIN'S GREAT-GREAT-GRANDDAUGHTER, RUTH PADEL When the eminent naturalist Charles Darwin returned from South America on board the H.M.S Beagle in 1836, he brought with him the notes and evidence which would form the basis of his landmark theory of evolution of species by a process of natural selection. This theory, published as The Origin of Species in 1859, is the basis of modern biology and the concept of biodiversity. It also sparked a fierce scientific, religious and philosophical debate which still continues today.

A dual publication of two of the author's influential works includes his nineteenth-century discussion of his revolutionary theory of evolution by means of natural selection and his 1839 account of his journeys to South America and the Pacific Islands.

States the evidence for a theory of evolution, explains how evolution takes place, and discusses instinct, hybridism, fossils, distribution, and classification.

Charles Darwin explains his theories of evolution by natural selection.

This is Charles Darwin's chronicle of his five-year journey, beginning in 1831, around the world as a naturalist on the H.M.S. Beagle.

States the evidence for a theory of evolution, explains how evolution takes place, and discusses instinct, hybridism, fossils, distribution and classification.

These three major works by the father of evolutionary theory encompass his life, journey through the Galapagos, and landmark work on natural selection. On the Origin of Species: In one of the most important contributions to scientific knowledge, Charles Darwin puts forth the theory that species evolve over time through the process of natural selection. Drawn from extensive research performed on various creatures living in the Galápagos Islands, his research suggests that "one species does change into another"—a revolutionary notion that has shaped much of modern biology. The Autobiography of Charles Darwin: Darwin wrote his autobiography as a family document in 1876. When it was originally published posthumously, certain portions were considered too personal or controversial and were removed. This edition restores those passages, shedding light on the women

in Darwin's life and his evolving views on religion. It also includes previously unpublished notes and letters on family matters, as well as Darwin's dispute with Samuel Butler. The Voyage of the Beagle: From volcanoes in the Galápagos to the coral reefs of Australia, this travelogue documents the young naturalist's historic, years-long journey at sea. Darwin's observations of the people, places, and events he experienced make for compelling reading and offer a fascinating window into the intellectual development of his ideas about natural selection.

The present edition contains selections from Darwin's Origin of Species that attempt to present the principal lines of argument, without becoming bogged down in details. It also includes notes and other remarks designed to help readers focus on what is essential in Darwin's argument for his theory of the development of living things.
